DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2. Claims 1-23 are rejected under 35 U.S.C. 102(e) as being anticipated by Dewan (U.S. Patent No. 7,043,008).

Regarding claims 1-23, Dewan teaches a system and method for selectively monitoring, recording, storing, and handling telephone conversations through the use of speech analysis. In particular, a speech analyzer analyzes a speech signal during a telephone conversation between two parties, and a recording and storage device records and stores the telephone conversation.

Art Unit: 2614

Based on variations in signal characteristics related to the emotional state of the caller, the system selectively generates a trigger to keep the stored recording of the telephone conversation. The invention also selectively determines whether to send a notification in response to said trigger. A monitoring and recording device monitors and records telephone conversations between the call center operators and the outside customers. A speech analyzer is used to monitor the communication between an operator and a customer during a telephone conversation, while a recording and storage device records the conversation. Based on variations in frequency and amplitude of the voice signals, the speech analyzer can identify changes in emotion of the parties. Once a change in emotion is detected which matches a predefined trigger event, the monitoring and recording device marks the recording of the call and can automatically alert the call operator's supervisor or supervisor's station. Additionally, detection of a triggering event may generate an alert to the call center supervisor or supervisor's station. The controller circuit transmits a report of the event and related identification data to the supervisor via computer network or other some other conventional data transmission method. The alert contains information such as the identity and location of the call operator and the type of event detected. Moreover, the supervisor could be given the option to "snoop" the call, which would allow the supervisor to listen to the conversation, or to take over the call altogether, by transferring the call from the operator's telephone to the supervisor's station, e.g., telephone (column 1, line 38 to column 2, line 3 and Figs. 1-4).

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Pertrushin (U.S. Patent No. 6,275,806) teaches a system, method and article of manufacture for detecting emotion in voice signals by utilizing statistics for voice signal parameters. Elazar (U.S. Patent No. 6,542,602) teaches a telephone call monitoring system.

4. Any response to this action should be mailed to:

Commissioner for Patents P.O. Box 1450 Alexandria, Virginia 22313-1450
